Identity Platform Research

You want a tool which can only be used by assigned people. Possible choices for this are: **AWS Cognito**, **Okta**, **Microsoft Entra ID**, **Azure Active Directory**. Since we are using Azure, it would make sense to choose either Microsoft Identity or Azure Active Directory.

The main difference between Microsoft Entra ID and Azure Active Directory is that Entra ID is focussed on internal users and partner companies. AD B2C is focussed on customers/clients.

We currently leave the decision open. We are using Auth0 for now since implementing Entra ID or AD will take too long and bring extra complications since we have to move tenant. Auth0 is not the best decision since anyone can login. But for development and testing it is sufficient for now.
