What Cloud Platform should I use?

According to my API Gateway research I should choose either AWS or Azure for their API Gateway. Both are very similar but there is a small reason to choose either above the other

Why AWS is a better choice

Low response time is a very big must in my project. The response times should be as low as possible since that's one of the key factors which makes an ecommerce successful. AWS appear to be the most available across the world, ensuring the website is fast no matter what location you access it from. (Kalimi, 2024)

AWS has more up to date documentation and is overall easier to learn and use. (ProjectPro, 2024)

Why Azure is a better choice

I am using C# for my backend services. Since both C# and azure are maintained by Microsoft it might be more beneficial to choose Azure mainly because of extra built in features/libraries/packages.

Post Research Message

AWS educate is simply a learning platform, not a platform I can use for my project. Making an AWS account requires a credit card which I don't have so it's impossible to create an AWS account.
